The MAXwms Warehouse Management System

MAXwms has been designed by IngenX Business Systems Ltd. to deliver the tools warehouse operators need to run their operations successfully… MAXwms is a user friendly, cost effective application that enables 3rd party OR private warehouse operators to manage their businesses as well as their inventories… with ease, efficiency, accuracy and reliability. MAXwms is a full featured, multi user, SQL server-based application designed for use with wireless scanners.

The MAXwms application has been designed and created by individuals with a great deal of experience in both the 3rd party warehousing and the wireless data collection industry.

As part of the evaluation process, we'll help you conduct a basic warehousing and inventory control needs assessment. We discuss the impact of initial setup decisions which have an effect on the activation of features on the handheld or vehicle mount scanners, activation of billing methods, how emails are sent from within the program and management reporting. We discuss how you would like to bill for services... For example: Monthly Calendar, Split Monthly Calendar or our unique Daily Storage Billing format which may just provide you with a competitive advantage... or a combination of any or all of these billing formats.

The time and date stamping benefits acquired through wireless data collection hardware are instrumental in helping you make decisions regarding productivity and profitability.

With MAXwms you will have the ability to receive product, using any one or all of the following methods:

1. Receive common cases, pallets, totes or bundles – variable quantities but 1 sku per pallet and the associate to a MAXwms generated pallet ID bar code
2. Receive multiple unique items (i.e. serial numbered items) and then bundle or associate those unique items to a single pallet ID barcode and have the capability of tracking the serial numbers on outbound Bills of Lading and Packing Slips
3. Receive product by scanning a customer's descriptive bar code which contains all of the processor's relevant data related to the product.

One or more of these three methods will meet the receiving requirements of virtually any third party warehouse operation.

Feature Overview:

- Unlimited customer contact records for each of your customers. i.e. primary contact, shipper, accounts payable clerk, logistics director, Vice Presidents, Presidents, etc. This is very useful in establishing "zippered in" relationships with your customers and your own management teams in terms of communicating at appropriate levels. Security access can be assigned at the customer contact level. If you don't want your accounts payable clerk or shipper to have access to the President of the company you are doing business with, you can very easily activate that setting and the user will simply not see that contact record.

- Import product data during initial setup or when you setup new large accounts

- MAXwms has an important on-hold capability where product placed on hold for any reason, does not show as available when creating pick slips.

- Export information from grids to excel or email virtually any information quickly and easily, directly to your customer or co-workers.

- Import orders/releases or inbound shipments using a pre-defined flat file format to minimize data entry requirements.

- Configure access to MAXwms tasks and menu items by user login and establish user security levels for individual users.

- Easily create Warehouse Receipt reports, handling and storage invoices, pick slips, BOL's, packing slips, lot allocation reports, transfer of ownership reports. AND... from the same screen, print or email directly to your customer.

- Create detailed shipping labels, BOL's and packing slips for outbound orders as well as MAXwms pallet ID barcode labels for inbound shipments.

- MAXwms maintains activity transaction tracking for each function or task performed when using MAXwms. For example: you may want to know which employee received a particular pallet, when and on which day. You may want to find who moved product from one location in the warehouse to another or who changed a rate or modified the quantity, weight, etc. All of this with a few clicks of the mouse.

- Users can create their own reports on the fly. They can also view, print, export to excel or email reports directly to the customer.

- MAXwms has a unique security dashboard feature which allows the administrator to determine access rights by user login. As employees gain increased responsibilities the access rights can be modified accordingly.

- Users have the ability to modify grids to provide a view of information that is important to them and then save those settings.

This summary highlights only a few of the many features available through the MAXwms solution.

Although it's an extremely powerful application, it's very affordably priced. And, the MAXwms basic offering includes a 10 user license (users defined as server, workstations and scanners.)

Additional users licenses are available as your needs change.

MAXwms has an optional customer web interface which provides on-line inventory access and visibility for you customers from your own website.

IngenX Business Systems Ltd., the developers of MAXwms can provide pre-programmed wireless data collection hardware or will help you select the right equipment and a reliable local service provider.
